

Ratio and Proportion Cheat Sheet

1. Writing a Ratio:

- The quantity written first is the numerator
- The word "to" separates the quantities
- The quantity written second is the denominator
- Always write in lowest terms, and always as a fraction

Example: Write the ratio of 60 days of sun to 20 days of rain.

$$\begin{array}{c} \div 2 \\ \swarrow \\ \frac{60}{20} = \frac{30}{10} = \frac{3}{1} \leftarrow \text{leave as a fraction} \\ \searrow \\ \div 10 \end{array}$$

- Ratios are written with LIKE terms

Example: 2 days to 8 hours
*2 days = 48 hours

$$\begin{array}{c} \div 8 \\ \swarrow \\ \frac{48}{8} = \frac{6}{1} \end{array}$$

2. Using Mixed Numbers in Ratios:

- Write out the ratio
- Write numbers as improper fractions
- Rewrite the problem horizontally, using the \div symbol
- Change the \div to \times and flip the second term

Example: 2 days to $2\frac{1}{4}$ days

$$\frac{2}{2\frac{1}{4}} = \frac{2}{\frac{9}{4}} = \frac{2}{1} \div \frac{9}{4} = \frac{2}{1} \times \frac{4}{9} = \frac{8}{9} \leftarrow \text{lowest terms}$$

3. Writing Rates:

Units are not the same and need to be included as part of the rate

- Write the rate as a fraction in lowest terms

Example: 160 dollars for 8 hours

$$\frac{160 \text{ dollars}}{8 \text{ hours}} = \frac{20 \text{ dollars}}{1 \text{ hour}}$$

4. Finding Unit Rates:

Denominator is 1

- Write the rate as a fraction
- Divide top number by the bottom number

Example: \$810 in 6 days

$$\frac{\$810}{6 \text{ days}} \longrightarrow 6 \overline{) 810} \longrightarrow \$135/\text{day}$$

$$\begin{array}{r} 135 \\ 6 \overline{) 810} \\ \underline{-6} \\ 21 \\ \underline{-18} \\ 30 \\ \underline{-30} \\ 0 \end{array}$$

use "per" or "/" to write unit rates

5. Finding the Best Buy:

The best buy is the item with the lowest cost per unit

- Divide the total price by the number of units
- Round to the thousandths if necessary
- Compare to find the lowest cost per unit

Example: Find the best buy for cereal.

12 ounces for \$2.49

14 ounces for \$2.89

$$12 \overline{) 2.49} = 0.2075$$

$$\begin{array}{r} 0.2075 \\ 12 \overline{) 2.49} \\ \underline{-2.4} \\ 09 \\ \underline{-0} \\ 90 \\ \underline{-84} \\ 60 \\ \underline{-60} \\ 0 \end{array}$$

$$14 \overline{) 2.89} = 0.20642$$

$$\begin{array}{r} 0.20642 \\ 14 \overline{) 2.89} \\ \underline{-2.8} \\ 09 \\ \underline{-0} \\ 90 \\ \underline{-84} \\ 60 \\ \underline{-56} \\ 40 \\ \underline{-28} \\ 12 \end{array}$$

\$0.2064/oz
*best buy

6. Finding Best Buy with Coupons:

- Take discount from coupon off total price
- Divide new total price by the number of units
- Compare to find the lowest cost per unit

Example: Find the best buy on grapes. You have a coupon for \$0.50 off 2 pounds, or \$0.75 off 3 pounds.

2 pounds for \$2.75 - \$0.50 coupon = \$2.25

3 pounds for \$4.15 - \$0.75 coupon = \$3.40

$$\begin{array}{r}
 1.125 \\
 2 \overline{) 2.25} \\
 \underline{-2} \\
 02 \\
 \underline{-2} \\
 05 \\
 \underline{-4} \\
 10 \\
 \underline{-10} \\
 0
 \end{array}$$

↑
\$1.125/lb
*best buy

$$\begin{array}{r}
 0.2075 \\
 12 \overline{) 2.49} \\
 \underline{-2.4} \\
 09 \\
 \underline{-0} \\
 90 \\
 \underline{-84} \\
 60 \\
 \underline{-60} \\
 0
 \end{array}$$

7. Writing Proportions:

A proportion states that two ratios are equal

- To write a proportion, write each ratio separately, with an equal symbol (=) in between.

Example: 5 is to 6 as 25 is to 30

$$\begin{array}{ccc}
 & \swarrow & \searrow \\
 & \frac{5}{6} = \frac{25}{30} & \\
 & \swarrow & \searrow
 \end{array}$$

- To check if a proportion is correct, cross multiply. The two cross products should be equal.

Example:

$$\begin{array}{c}
 \frac{5}{6} \times \frac{25}{30} \\
 \downarrow \\
 5 \times 30 = 6 \times 25 \\
 150 = 150
 \end{array}$$

← the products are equal
so the proportion is true

8. Solving the Proportion:

- Cross multiply
- Show that the cross products are equal
- Divide both sides by the number touching "x"

Example:

$$\begin{array}{l} \frac{12}{x} = \frac{6}{8} \\ \downarrow \\ \frac{12}{x} \times \frac{6}{8} \quad \leftarrow \text{cross multiply} \\ \downarrow \\ 12 \times 8 = x \times 6 \quad \leftarrow \text{cross products are equal} \\ 96 = 6x \\ \downarrow \\ \frac{96}{6} = \frac{6x}{6} \quad \leftarrow \text{Divide both sides by 6 to get x by itself} \\ \downarrow \\ 16 = x \quad \leftarrow \text{x is 16} \end{array}$$

- To check your work, place your value for x in the proportion and multiply to see that the cross products are equal \leftarrow we found x=16

Example:

$$\begin{array}{l} \frac{12}{x} = \frac{6}{8} \\ \downarrow \\ \frac{12}{16} \times \frac{6}{8} \quad \leftarrow \text{replace x with 16} \\ \downarrow \\ 12 \times 8 = 16 \times 6 \quad \leftarrow \text{cross multiply} \\ \downarrow \\ 96 = 96 \quad \leftarrow \text{cross products are equal} \end{array}$$
